

AI Studio Automation Brief

Executive summary for Maggie - operations automation plus AI-assisted production.

Goal: reduce assistant-heavy studio overhead while keeping human approval for creative, client-facing, financial, and publishing decisions.

System concept: two machines, one control model. The Mac mini hosts the always-on Studio Brain for lead handling, inbox drafting, reminders, CRM updates, and social content queues. The Mac Pro or main production workstation handles session prep, AI-assisted rough mixes, mastering passes, QC, and delivery. OpenClaw orchestrates, n8n routes, Docker contains services, Ollama runs local models, and humans approve sensitive actions.

Five modules

#	Module	Purpose
1	Session Intake & Prep	Validate assets, organize stems, and build the working session.
2	AI Mix & Master	Create strong starting mixes and mastering variants for review.
3	Automated QC & Delivery	Catch technical issues and assemble clean delivery packages.
4	Studio Brain / Operations	Automate lead handling, email drafts, reminders, content planning, and project tracking.
5	Engineer Review & Revision	Translate notes into controlled changes and keep final taste decisions human.

Why it works

- Cuts repetitive freelance overhead and protects more time for paid creative work.
- Keeps privacy high with local models and bounded tool wrappers.
- Improves consistency through templates, QC gates, audit trails, and approval queues.
- Starts small: build the Mac mini operations brain first, then automate session prep, QC, and revision handling on the production machine.
